Anti-GABA$_A$ Receptor, α$_1$-Subunit, N-Terminus

Catalog Number: 812-GA1N **Size:** 100 µl $310.00

Product Description: Affinity purified rabbit polyclonal antibody

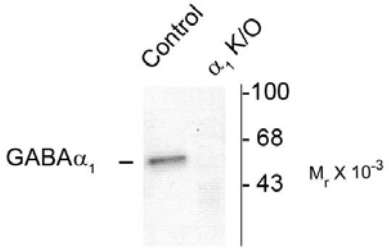
Applications: **WB**: 1:1000

Antigen: Peptide from the N-terminal region of the α$_1$-subunit of rat GABA$_A$ receptor, conjugated to keyhole limpet hemocyanin (KLH).

Species reactivity: The antibody has been directly tested for reactivity in Western blots with mouse and rat tissue. It is anticipated that the antibody will react with bovine, canine, human and non-human primate tissues based on the fact that these species have 100% homology with the amino acid sequence used as antigen.

Biological Significance: *Gamma*-aminobutyric acid (GABA) is the primary inhibitory neurotransmitter in the central nervous system, causing a hyperpolarization of the membrane through the opening of a Cl^- channel associated with the GABA$_A$ receptor (GABA$_A$-R) subtype. GABA$_A$-Rs are important therapeutic targets for a range of sedative, anxiolytic, and hypnotic agents and are implicated in several diseases including epilepsy, anxiety, depression, and substance abuse. The GABA$_A$-R is a multimeric subunit complex. To date six αs, four βs and four γs, plus alternative splicing variants of some of these subunits, have been identified (Olsen and Tobin, 1990; Whiting et al., 1999; Ogris et al., 2004). Injection in oocytes or mammalian cell lines of cRNA coding for α- and β-subunits results in the expression of functional GABA$_A$-Rs sensitive to GABA. However, coexpression of a γ-subunit is required for benzo-diazepine modulation. The various effects of the benzodiazepines in brain may also be mediated via different α-subunits of the receptor (McKernan et al., 2000; Mehta and Ticku, 1998; Ogris et al., 2004; Pöltl et al., 2003).

Anti-GABA$_A$ Receptor, α$_1$-Subunit



Western blot of mouse forebrain lysates from Wild Type (Control) and α$_1$-knockout (α$_1$-K/O) animals showing specific immunolabeling of the ~51k α$_1$-subunit of the GABA$_A$-R. The labeling was absent from a lysate prepared from α$_1$-knockout animals.

WB = Western Blot **IF** = Immunofluorescence **IHC** = Immunohistochemistry **IP** = Immunoprecipitation
Packaging: 100 µl in 10 mM HEPES (pH 7.5), 150 mM NaCl, 100 µg per ml BSA and 50% glycerol. Adequate amount of material to conduct 10-mini Western Blots.
Storage and Stability. For long term storage –20°C is recommended. Stable at –20°C for at least 1 year.
Shipment: Domestic - Blue Ice; International – Blue Ice or Dry Ice.

Purification Method: Prepared from rabbit serum by affinity purification using a column to which the peptide immunogen was coupled.

Antibody Specificity: Specific for the ~51k α_1-subunit of the $GABA_A$ receptor in Western blots of rat brain. Labeling is absent in α_1-subunit knockout animals.

Quality Control Tests: Western blots performed on each lot.
